# 1. INTRODUCTION 引言

## 1.1 Adverse impacts of urbanization 城市化的負面影響

- population growth 人口增長
- habitat loss 棲息地破壞
- pollution 污染
- climate change 氣候變化

## 1.2 Concrete jungles 石屎森林

- urban heat island effect 城市熱島效應
- higher night temperature 提升夜間溫度
- elevated air particulate contents  
增加空氣微粒含量
- urban canyon 城市峽谷
- lack of greening space 綠化空間短缺

# 1.3 Urban landscaping 都市绿化

(This illustration is inspired by:  
Scientific American, September 2011)

Green / Liveable City 绿色/宜居城市

# Vegitecture

Urban Greening for the Future?

未來城市綠化？

Architecture for the Future?

未來建築？

## 1.4 Vertical greenery as alternative 垂直綠化？

- tall building blocks 高樓大廈
  - high wall:roof 高牆：屋頂
  - large SA 更大表面面積
- free up precious ground space for other uses 騰出珍貴的地面空間作其他用途
- alleviate increased solar heat interception by urban canyon 減輕城市峽谷的太陽熱能截取
- alleviate visual barrier in concrete jungles 緩解石屎森林的視覺障礙

## 2. VERTICAL GREENING 垂直綠化

- vertical garden/living curtain/green wall/green facade  
垂直綠化、壁面綠化、立體綠化、綠牆、植生牆
- horticultural practices that expand and extend vertically in space  
垂直延伸的園藝種植方法
- free-standing or part of a building  
獨立式或成為建築物的一部分
- partial or complete vegetation coverage  
部分或完全被植被覆蓋
- outdoor or indoor 室外或室內

## 2.1 Types of vertical greening method 垂直綠化方法及種類

### Facade greening / Green wall

- support system 支架式系統
  - vines 藤本植物
    1. on soils at ground/elevated level  
地面上/高架位置的花槽
    2. grow on support 支架上生長

On-the-ground type  
using vines  
在地面種植藤本植物

Elevated planter  
高架種植

Exterior of a railway station in Hong Kong. *Parthenocissus himalayana* can directly attach to brick or concrete surface.  
香港一火車站的外觀 - 爬山虎直接生長在磚或混凝土表面。

Vines can grow on wires and pergolas to form a green cover on building.  
藤蔓可在金屬線和棚架上生長，形成一個綠色覆蓋的建築物。

## Elevated planters 高架種植

- raised planters/elevated boxes at certain height  
使用高架花槽
- climbing and hanging plants, other herbaceous plants  
攀爬和懸掛植物、其他草本植物
- weight loads – light soil mixes 負載重量 – 輕混合土壤

Elevated planters on a commercial building in Ginza, Japan.

日本銀座一商業樓宇的高架花盆。

Shower of gold climber on the Library at the Singapore National Management University. 新加坡國立管理大學三星果藤。

## 2.1 Types of vertical greening method 垂直綠化方法及種類

### Wall planting / Living wall

- carrier system 承載式系統
  - groundcovers, grasses, sedges, ferns and even shrubs  
地被植物、禾本科、莎草科、蕨類甚至灌木
- 1. on soils contained within modular planters mounted on wall 模塊花盆安裝在牆上
- 2. irrigation system on top 頂部裝灌溉系統

Modular planter 模塊式花盆

# Vertical Greenery Systems

## 垂直綠化系統

Major types of VGS according to planter position and orientation

根據花盆位置和方向分辨主要垂直綠化的類型

# 3. RESEARCH IN VERTICAL GREENING

## 垂直绿化研究

Number of SCI publications (N=49) on vertical greening from 2000 to 2014 (June) classified by greenery systems and research topics.

## **3.1 Our research on vertical greening**

### **3.1.1 Assessment of the temperature reduction ability of support-type vertical greening system**

- support system
- outdoor
- east-facing wall
- 13 species (climbers)
- on planters and metallic mesh

*Bauhinia glauca*  
羊蹄甲藤

*Bougainvillea spectabilis*  
簕杜鹃

*Clerodendrum thomsonae*  
龍吐珠

*Clitoria ternatea*  
藍花豆

*Lonicera japonica*  
忍冬

*Mandevilla x amabilis*

## Summary

- There were difference in thermal reduction performance between the various species studied.
- *Pyrostegia venusta* was significantly higher than *Bauhinia glauca* in their temperature reduction ability in the support-type vertical greening system.
- Thermal performance was significantly related to canopy attributes such as canopy thickness, canopy coverage and LAI.
- Denser, thicker and better-covered vegetation was better in terms of microclimate modification.

### 3.1.2 Assessment of the temperature reduction ability of carrier-type vertical greening system

- carrier system
- outdoor
- east-facing wall
- 2 species
  - *Ophiopogon japonicus* cv. Nanus 日本蒲草
  - *Nephrolepis exaltata* 波士頓蕨
- on modular panels

Experimental setup

Modular panel

## Canopy characteristics of *Ophiopogon japonicus* cv. Nanus and *Nephrolepis exaltata* on the vertical greenery system

### *Ophiopogon japonicus*   *Nephrolepis exaltata*

	Mean	SD	Mean	SD
Plant height (cm)	6.0	0.3	16.8	1.2
Canopy thickness (cm)	4.9	0.3	14.5	1.0
Canopy coverage (%)	55	1	71	5
LAI	0.63	0.06	1.10	0.11

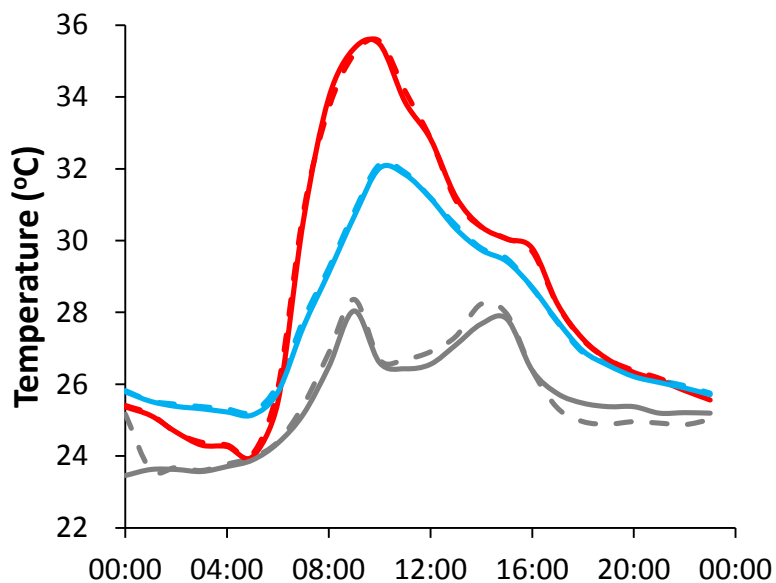

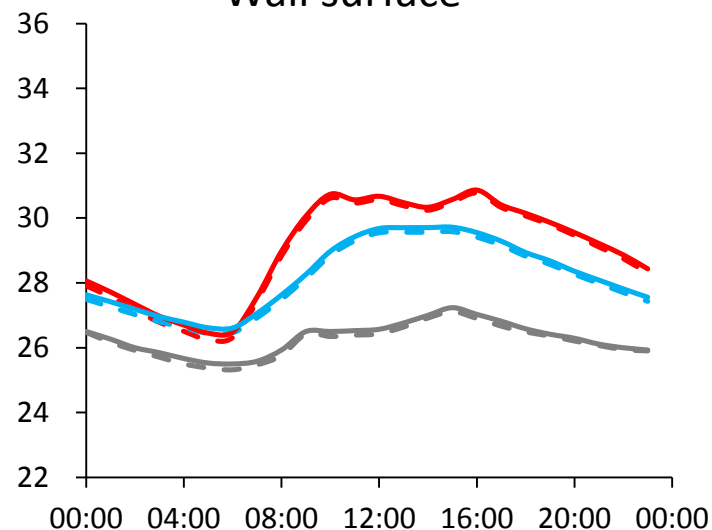

Temperature trends of *Ophiopogon japonicus* cv. Nanus (upper) and *Nephrolepis exaltata* (lower) on the substrate surface.

*Nephrolepis exaltata*

*Ophiopogon japonicus*

Substrate surface

Wall surface

Diurnal temperature changes behind canopy and panel

## Summary

- *Nephrolepis exaltata* was significantly higher than *Ophiopogon japonicus* cv. Nanus in their temperature reduction ability in carrier-type vertical greening system.
- This was attributed to its denser coverage & taller individuals.
- *Nephrolepis exaltata* reduced 1.5°C behind canopy while *Ophiopogon japonicus* cv. Nanus was ineffective.
- Temperature reduction on the wall surface was negligible with or without vegetation.
- Species selection for carrier type vertical greening in maximizing temperature reduction efficiency would not be significant when there was thick substrate (thermal mass) with high *in situ* water content (thermal buffer).

### 3.1.3 Performance comparison between support-type and carrier-type vertical greenery systems

- Species with best temperature reduction ability
  - *Pyrostegia venusta* and *Nephrolepis exaltata*
- Focused on wall surface temperature reduction which affects cooling energy loads and indoor living comfort

Diurnal temperature changes at various locations

# Average daily maximum temperature of bare wall surface, ambient air and different locations of the support-type system and carrier-type system

	Daily maximum temperature (°C) <sup>a</sup>	Wall surface temperature reduction (°C)	
<b>Bare wall surface</b>	35.2	a	
<b>Ambient air</b>	31.9		
<b>Support system</b>			
Air-canopy interface	34.9		
Air cavity	33.9		
Wall surface	31.3	b	3.8
<b>Carrier system</b>			
Air-canopy interface	34.0		
Substrate surface	32.4		
Wall surface	28.8	c	6.4

<sup>a</sup>One-way ANOVA followed by Tukey HSD post-hoc test to determine any significant difference between mean daily maximum wall surface temperature

Wall surface temperature under two types of vertical greenery systems and a bare wall

## Summary

- Support-type VG system was less effective than carrier-type in heat reduction at the wall surface.
- Despite this thermal advantage, there was a lag in heat transfer in the wall of carrier system, which resulted in slower cooling in late afternoon and higher temperature than bare wall after sunset.
- A higher continuous inflow of heat at nighttime would likely to cause excessive air-conditioning or discomfort to residents in hot summer nights.
- Although carrier-type vertical greenery system did better in heat reduction, it should be carefully selected for its installation in residential buildings.

## 4. FUNCTIONAL STRUCTURE AND BEHAVIOR

### 系統結構及性能分析

- System type - design features and mechanism  
系統種類;設計特色與結構
- Plant selection and in cooperation with VGS  
植物應用與系統配合
- Irrigation application and characteristics  
灌溉系統應用與設計特色
- Substrate characteristics  
基質特性

## 4.1 Irrigation application and characteristics

### 灌溉系統應用與設計特色

Automation by timer switch  
(cheaper but prone to dry spell)  
or by moisture sensor.

自動化定時開關或濕度傳感器。

CASCADING DRIP

PRECISION DRIP

Chiang & Tan, 2009

Proper selection of irrigation system:

- Reduce water wastage
- Improve water distribution evenness
- Increase plant survival

Related to irrigation program and substrate properties

## 4.2 Substrate characteristics

### 基質特性

#### Substrate characteristics:

- sandy; rocky; organic

#### Physical properties:

- porosity; water holding capacity; permeability; water retention

#### Chemical properties:

- pH; nutrient contents

## 4.4 VGS maintenance requirement

### 管理技術與要求

- Maintenance = time + labor + sustainability =
- Maintenance issues:
  - ▣ system/irrigation/vegetation (repair)
  - ▣ pest/weed control
  - ▣ fertilization/fungicide
  - ▣ sanitization (especially important for indoor VG)

## 5. PROSPECTS & POTENTIALS 發展前景和潛力

- New dimension in urban landscaping & green building development?  
城市園林綠化與綠色建築的新發展方向?
- System optimization in terms of functional performance, operational cost, maintenance, sustainability by matching the plant needs and system design  
通過植物篩選和系統設計，優化系統的性能、運營成本、維護和可持續性

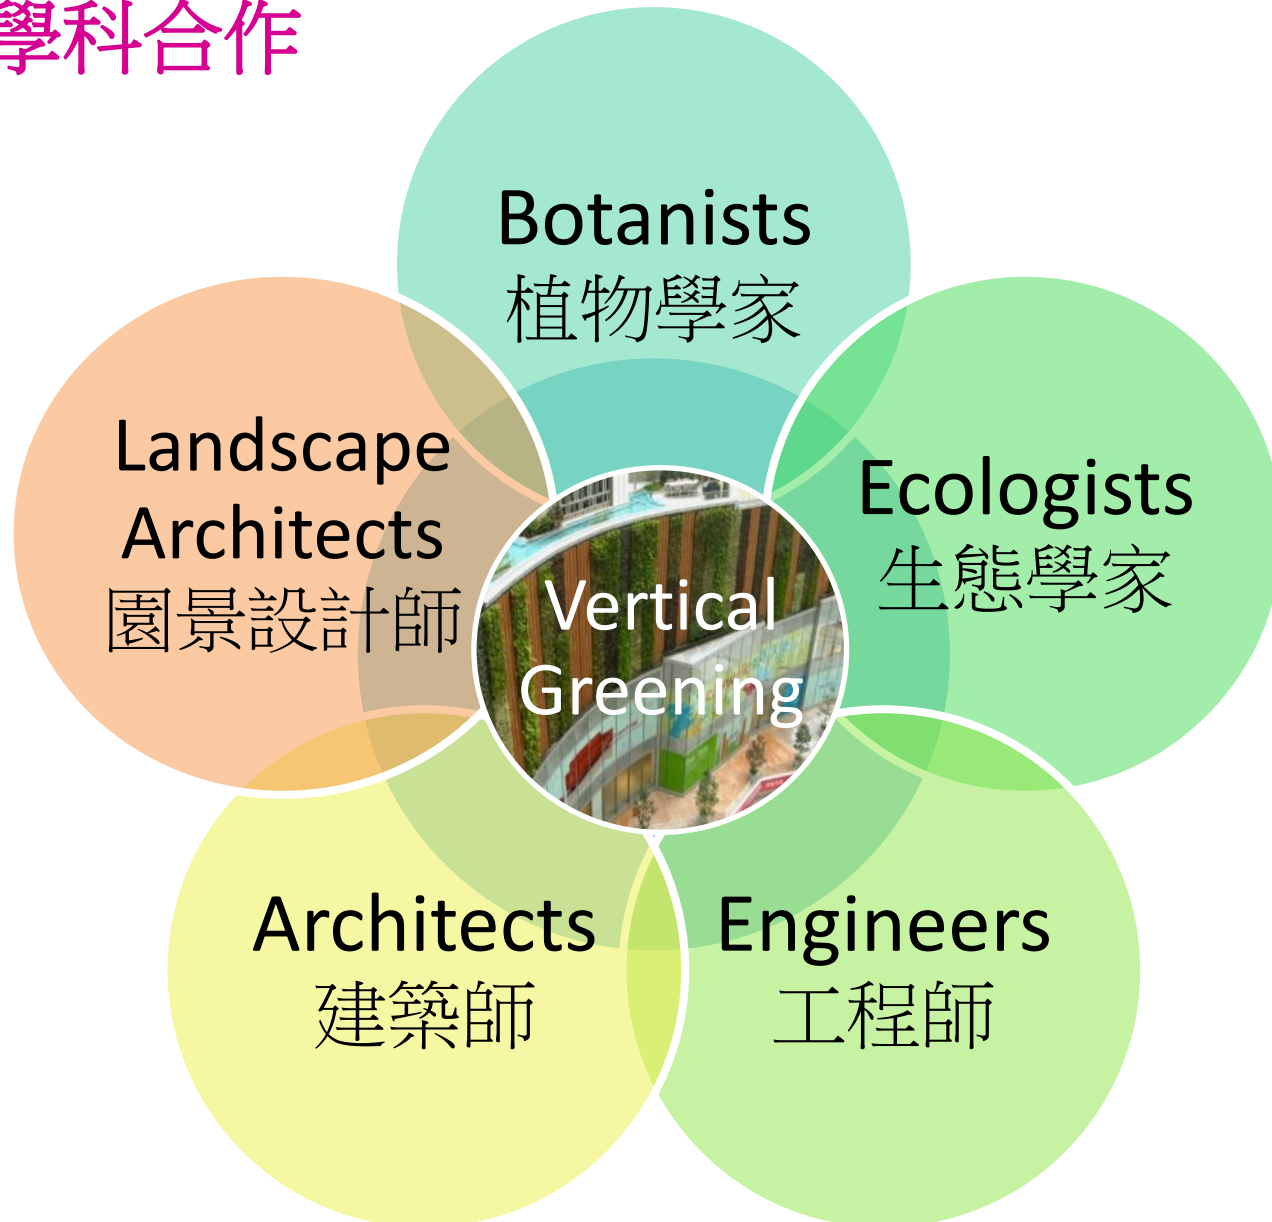

## 6. OTHER CONSIDERATIONS 其他考慮因素

# 7. INTERDISCIPLINARY COLLABORATION

## 跨學科合作
